QUICK START

Know exactly what your site says.

The Web Scraper reads your own pages on a schedule and turns them into the knowledge your AI answers from — so an answer is never older than the page it came from.

1

Point it at your site

Give it a starting address. It follows your links and stays on your domain.

2

Choose how deep to read

A single page, a section, or the whole site. You decide what counts as yours.

3

Review what it found

Every page is listed before anything is trusted. Remove what should not be answered from.

4

Put it on a schedule

Daily or weekly, it re-reads and updates. Change a page, and the answers change with it.

5

Answer from it everywhere

Chat and phone draw from the same crawl, so a caller and a visitor get the same answer.
